

Identify B-Cell Malignancies with Early Diagnosis

Significance

The IHC - CD20 (Outlab) test is an immunohistochemistry test used to detect the presence of the CD20 protein on the surface of B-lymphocytes (a type of white blood cell). It helps in diagnosing and classifying certain types of lymphomas and leukemias, particularly B-cell related cancers. This test identifies the type of blood cancer and also helps in deciding treatment options, especially therapies that target CD20-positive cells.
