

PCP Test to Identify Drug Use and Health Risks

Significance

The Phencyclidine (PCP) Test is used to detect the presence of phencyclidine, a hallucinogenic drug often known as “angel dust,” in the body. It helps identify recent or past use of PCP, which can cause severe behavioral changes, hallucinations, confusion and even dangerous health effects. This test is commonly used in cases of suspected drug abuse, overdose, or for monitoring in rehabilitation and workplace drug screening programs.

Phencyclidine
