Identify and Manage Muscle Disorders

Significance

The Aldolase test measures the level of the enzyme aldolase in the blood, which is primarily found in muscle tissues. It is significant for diagnosing and monitoring muscle damage or disorders, such as muscular dystrophy, polymyositis and dermatomyositis. The test can also be used to assess liver disease, as aldolase is present in the liver as well. It is a useful tool for identifying muscle degeneration, inflammation and injury, guiding treatment and management of muscle-related conditions.
