All-in-One Test To Detect

Clotting Dangers

Safeguard Pregnancy

Spot Autoimmunity

Significance

The Anti Phospholipid Antibody (APL) - IgG test detects IgG antibodies that mistakenly target phospholipids, which are essential components of cell membranes. These antibodies are often associated with autoimmune conditions like antiphospholipid syndrome (APS), which can lead to increased risk of abnormal blood clotting, miscarriages, and other complications. The test helps in diagnosing and monitoring autoimmune disorders and assessing the risk of clot-related health issues.
